The material contained in this guide is based upon technical data and tests made available by various chemical manufacturers and users.

The purpose of this information is to provide a GENERAL GUIDE regarding the use of various chemicals with CAT PUMPS products. This guide is not intended as an absolute materials recommendation.

Factors that may affect the material or elastomer composition in a pump using liquid chemical(s) are:

- chemical concentration
- aeration
- impurities
- duty cycle
- temperature
- viscosity
- mixing of chemicals
- pH rating
- pump RPM
- vapor point

The only reliable means of making a final selection is actual field testing under the conditions of intended use. CAT PUMPS assumes no liability for results obtained or damage incurred through the application of the data presented in this guide.

LEGEND

- A** Elastomer/material shows little or no effect after exposure to the chemical.
- B** Elastomer/material may be affected after exposure chemical. Swelling and/or a loss of physical properties is possible.
- C** Elastomer/material is effected after exposure to the chemical. Moderate or severe swelling and loss of physical properties will limit life of the elastomer/material.
- U** Elastomer/material is unsuitable when exposed to the chemical.
- *** For fluid to remain in liquid state, pressure or temperature may exceed inlet seal specifications.
- ^** A special compound may be required. Contact Cat Pumps for recommendations.
